

Page Pairer Demo QuickStart Guide

1. Download Page Pairer (server and client) from the Downloads page on the Farrukh Systems website (www.farrukh.co.uk).
2. Install the server software first, following the installer instructions.
3. Once the installer has finished, start Page Pairer from the Start menu. A warning message will appear, saying ***The server shared volume has not been specified.*** Click OK.
4. The Installation dialog will appear, as below.

5. Select **Page Pairer Demo** from the Version list.
6. In the Server Shared Volume field, enter the path to a shared folder on the server. This will be used by the Page Pairer to pass information between the server and the clients
7. The Dongle Number field should display a 12 digit number, the Users field and Queues field should both be set to 5. Do not close this dialog.
8. Contact Farrukh Systems Support. on +44 207 208 4249 and ask for a Page Pairer Demo Code. You need to give the Dongle Number and you will get a release code that will enable the server.
9. Enter the release code and click OK. The server should now start running.

Please note: The Dongle Number will change if Page Pairer server software is quit or the computer turned off. Contact us for a new release code.

Now you should install the Page Pairer client software. When the client starts up it will ask for the location of the login volume. This is the folder named **iplogin** created inside the folder specified in point 6 above. Once the client is logged in you can create queues and display progress. See the full manual for more details.
